

# Structural Fire Engineering

## Employment Opportunity

### Who are we...

Semper was formed by a small group of individuals who had a desire to develop a company which focused on fire engineering, and in particular, its creativity and potential for change. As a purely fire engineering company we have a desire to break down complex problems and develop appropriate solutions based on an understanding of the relationships between safety, design flexibility and cost. We have grown organically and now have around 30 staff working between London, Birmingham, Frankfurt and Madrid.

### Company Structure

The business structure (“innovation”, “design” and “assurance”) is driven by a desire to offer seamless fire safety advice at all design and construction stages. As we see it, this is the best way of working as it overcomes the fragmentation that has burdened this discipline for many years.

Our structure is unique within the industry. It allows for completely joined-up thinking at all stages with the correct level of competence in every area. It also ensures we can implement new and improved fire safety solutions across the board with minimum disruption.

### What we are looking for...

We are currently on a journey to become the first fire engineering company to offer fully quantified solutions for building fire safety. To help us achieve this we are looking for people to join us who have strong skills in fire and structures and experience using SAFIR software.

If the above sounds interesting then please forward CV's to [CraigEnglish@sempergrp.com](mailto:CraigEnglish@sempergrp.com)

Positions are also available to those who think they may have an interest in a more general fire engineering / building design role.
